

Ahmat Barkai Moussa

Task 8 : Interceptor Hazırlanması : Oluşturduğunuz tablo üzerinde CRUD operasyonları gerçekleştirdiği an araya giren ve terminale log atan interceptor'ları yazın. 5 interceptor'ı da araştırın ve kısaca ne yaptıklarından bahsedin.

1 – create için :interceptor package'inde

TrainingProductCreateInterceptor oluşturuyoruz ve InitDefaultsInterceptor'ı implements ederek modelimizi parametre olarak veriyoruz . OnInitDefaults metodu override edip içinde log ile terminale mesaj veriyoruz yeni bir product create ettiğimiz an .

```
package com.avansas.core.interceptors;

import com.avansas.core.model.TrainingProductModel;
import de.hybris.platform.servicelayer.interceptor.InitDefaultsInterceptor;
import de.hybris.platform.servicelayer.interceptor.InterceptorContext;
import de.hybris.platform.servicelayer.interceptor.InterceptorException;

import java.util.logging.Logger;

public class TrainingProductCreateInterceptor implements InitDefaultsInterceptor<TrainingProductModel> {

    private static final Logger LOG = Logger.getLogger(String.valueOf(TrainingProductCreateInterceptor.class));

    @Override
    public void onInitDefaults(TrainingProductModel trainingProductModel, InterceptorContext interceptorContext) throws InterceptorException {
        LOG.info(msg, "creating new product in Training Product ");
        LOG.info(msg, "The created product is named : " + trainingProductModel.getProductName());
    }
}
```

Ve avansascore-spring.xml'de yeni oluşturduğumuz class'ı tanımlıyoruz ve interceptorumuza da dahil ediyoruz ,interceptor mapping'de ve typecode'u ise modelimizi veriyoruz (tableName).

```
<!-- Task 8 interceptors beans -->

<bean id="trainingProductCreateInterceptor" class="com.avansas.core.interceptors.TrainingProductCreateInterceptor"/>
<bean id="trainingProductCreateInterceptorMapping" class="de.hybris.platform.servicelayer.interceptor.impl.InterceptorMapping">
    <property name="interceptor" ref="trainingProductCreateInterceptor"/>
    <property name="typeCode" value="TrainingProduct"/>
</bean>
```

2-Veri tabanından veri çekildiği an LoadInterceptor çalışması için interceptor package'inde TrainingProductLoadInterceptor sınıfı oluşturuyoruz ve LoadInterceptor'ı implements ederek modelimizi parametre olarak veriyoruz . Onload metodu override edip içinde log ile terminale mesaj verilir bir product veritabanından çekildiği an .

```
loadInterceptor
e-items.xml x TrainingProductCreateInterceptor.java x TrainingProductLoadInterceptor.java x TrainingProductRemoveInterceptor.java x avas
package com.avansas.core.interceptors;

import com.avansas.core.model.TrainingProductModel;
import de.hybris.platform.servicelayer.interceptor.InterceptorContext;
import de.hybris.platform.servicelayer.interceptor.InterceptorException;
import de.hybris.platform.servicelayer.interceptor.LoadInterceptor;

import java.util.logging.Logger;

2 usages
public class TrainingProductLoadInterceptor implements LoadInterceptor<TrainingProductModel> {
1 usage
    private static final Logger LOG = Logger.getLogger(String.valueOf(TrainingProductLoadInterceptor.class));

    @Override
    public void onLoad(TrainingProductModel trainingProductModel, InterceptorContext interceptorContext) throws InterceptorException {
        LOG.info( msg: "Loading Training Product named : " + trainingProductModel.getProductName());
    }
}
```

Ve avansascore-spring.xml'de yeni oluşturduğumuz class'ı tanımlıyoruz ve interceptorumuza da dahil ediyoruz ,interceptor mapping'de ve typecode'u ise modelimizi veriyoruz (tableName).

```
<bean id="trainingProductLoadInterceptor" class="com.avansas.core.interceptors.TrainingProductLoadInterceptor"/>
<bean id="trainingProductLoadInterceptorMapping" class="de.hybris.platform.servicelayer.interceptor.impl.InterceptorMapping">
    <property name="interceptor" ref="trainingProductLoadInterceptor"/>
    <property name="typeCode" value="TrainingProduct"/>
</bean>
```

3-Product silinmek intenddiği an remove interceptoru oluşturuyoruz : TrainingProductRemoveInterceptor sınıf oluşturuyoruz ve RemoveInterceptor interface'ı implements ediyoruz ve parametre olarak TrainingProductModel'i veriyoruz onRemove motodu override edip içinde bussiness logic'lerimizi yazıyoruz .

```

package com.avansas.core.interceptors;

import com.avansas.core.model.TrainingProductModel;
import de.hybris.platform.servicelayer.interceptor.InterceptorContext;
import de.hybris.platform.servicelayer.interceptor.InterceptorException;
import de.hybris.platform.servicelayer.interceptor.RemoveInterceptor;

import java.util.logging.Logger;

2 usages
public class TrainingProductRemoveInterceptor implements RemoveInterceptor<TrainingProductModel> {
    1 usage
    private static final Logger LOG = Logger.getLogger(String.valueOf(TrainingProductRemoveInterceptor.class));

    @Override
    public void onRemove(TrainingProductModel trainingProductModel, InterceptorContext interceptorContext) throws InterceptorException {
        LOG.info( msg: "Removing Training Product named : " + trainingProductModel.getProductName());
    }
}

```

Oluşturduğumuz class için ve interceptor için gereken beans'leri yazıyoruz.(interceptorMapping kullanarak)

```

<bean id="trainingProductRemoveInterceptor" class="com.avansas.core.interceptors.TrainingProductRemoveInterceptor"/>
<bean id="trainingProductRemoveInterceptorMapping" class="de.hybris.platform.servicelayer.interceptor.impl.InterceptorMapping">
    <property name="interceptor" ref="trainingProductRemoveInterceptor"/>
    <property name="typeCode" value="TrainingProduct"/>
</bean>

```

4-Update ve Validate için :

```

package com.avansas.core.interceptors;

import com.avansas.core.model.TrainingProductModel;
import de.hybris.platform.servicelayer.interceptor.InterceptorContext;
import de.hybris.platform.servicelayer.interceptor.InterceptorException;
import de.hybris.platform.servicelayer.interceptor.PrepareInterceptor;

import java.util.logging.Logger;

2 usages
public class TrainingProductUpdateInterceptor implements PrepareInterceptor<TrainingProductModel> {
    1 usage
    private static final Logger LOG = Logger.getLogger(String.valueOf(TrainingProductUpdateInterceptor.class));

    @Override
    public void onPrepare(TrainingProductModel trainingProductModel, InterceptorContext interceptorContext) throws InterceptorException {
        LOG.info( msg: "Updating Training Product named : " + trainingProductModel.getProductName());
    }
}

```

```

package com.avansas.core.interceptors;

import com.avansas.core.model.TrainingProductModel;
import de.hybris.platform.servicelayer.interceptor.InterceptorContext;
import de.hybris.platform.servicelayer.interceptor.InterceptorException;
import de.hybris.platform.servicelayer.interceptor.ValidateInterceptor;

import java.util.logging.Logger;

2 usages
public class TrainingProductValidateInterceptor implements ValidateInterceptor<TrainingProductModel> {

    1 usage
    private static final Logger LOG = Logger.getLogger(String.valueOf(TrainingProductValidateInterceptor.class));

    @Override
    public void onValidate(TrainingProductModel trainingProductModel, InterceptorContext interceptorContext) throws InterceptorException {
        LOG.info( msg: "Validating Training Product named : " + trainingProductModel.getProductName());
    }
}

```

Beans'leri tanımlıyoruz

```

<bean id="trainingProductUpdateInterceptor" class="com.avansas.core.interceptors.TrainingProductUpdateInterceptor"/>
<bean id="trainingProductUpdateInterceptorMapping" class="de.hybris.platform.servicelayer.interceptor.impl.InterceptorMapping">
    <property name="interceptor" ref="trainingProductUpdateInterceptor"/>
    <property name="typeCode" value="TrainingProduct"/>
</bean>

<bean id="trainingProductValidateInterceptor" class="com.avansas.core.interceptors.TrainingProductValidateInterceptor"/>
<bean id="trainingProductValidateInterceptorMapping" class="de.hybris.platform.servicelayer.interceptor.impl.InterceptorMapping">
    <property name="interceptor" ref="trainingProductValidateInterceptor"/>
    <property name="typeCode" value="TrainingProduct"/>
</bean>

<!--Interceptor crud beans finished -->

```

Ant clean ve serveri ayağa kalıyoruz .

Sonuçlar :

Database'e tablomuza ulaşınca terminale mesajımızı gelmektedir :

TrainingProduct.companyName	PK ▼	TrainingProduct.productName
amour	8796322459652	oil
apple	8796224155652	mackbook
samsun	8796191387652	molse

```

```

Debuglararak tek tek fonksiyonlarımıza düşüyor .

Görsellerden sonra

```
LOG.info(" ***** CREATING ***** ");
```

Fonksiyonu eklenmiş.

II- 5 Interceptor'ların açıklaması :

1-InitDefaultInterceptor : bu interceptor yeni bir model oluşturulduğu an çağırılmaktadır , modelService.create(model) kullanarak ve onInitDefault metodunu override ediyor .

2-LoadInterceptor : database'ten veri çekilince çağırılmaktadır .

modelService.get()'i kullanıyor. Bu interceptor onLoad() metodu override ediyor .

3-RemoveInterceptor : Bu interceptor database'te veri silinice çalışmaktadır (modelService.remove()) bu ise onRemove metodunu override ediyor .

4-PrepareInterceptor : veri update edince çalışmaktadır ve onPrepare metodunu override ediyor .

5-Ve ValidateInterceptor : Hemen prepareInterceptor'dan sonra yer almaktadır veri tabanına save etmek istediğimizi kontrol edilip öyle veri tanına kayıt edilmektedir .Bu interceptor onValidate kullanmaktadır .
