

Ahmat Barkai Moussa

Task 4 : Profil düzenleme sayfasında isim ve soyisim arasına ikinci isim alanı ekleyin. Veriyi getirme ve kaydetme işlemlerini gerçekleştirin.

-Tabloda bir alan ekliyoruz secondName adına. Customer itemtype'ta.

```
<itemtype code="Customer" generate="false" autocreate="false">
  <attributes>
    <attribute qualifier="accountDisabledDate" type="java.lang.String">
      <persistence type="property"/>
    </attribute>

    <attribute qualifier="secondName" type="java.lang.String">
      <persistence type="property"/>
    </attribute>

    <attribute qualifier="isDisableCustomerByASM" type="java.lang.Boolean">
      <description>Defines if the customer account has been closed by customer service
      </description>
      <persistence type="property"/>
    </attribute>
    <attribute qualifier="phoneNumber" type="java.lang.String">
      <description>Defines customer phone number</description>
      <persistence type="property"/>
    </attribute>
    <attribute qualifier="regularPhoneNumber" type="java.lang.String">
      <persistence type="property"/>
    </attribute>
    <attribute qualifier="optinSms" type="java.lang.Boolean">
      <description>Defines if the customer wants to receive future marketing information by SMS
      </description>
      <persistence type="property"/>
      <defaultvalue>java.lang.Boolean.FALSE</defaultvalue>
    </attribute>
    <attribute qualifier="optinEmail" type="java.lang.Boolean">
      <description>Defines if the customer wants to receive future marketing information by e-mail
      </description>
      <persistence type="property"/>
      <defaultvalue>java.lang.Boolean.FALSE</defaultvalue>
    </attribute>
    <attribute qualifier="optinCallCenter" type="java.lang.Boolean">
      <description>Defines if the customer wants to receive future marketing information by
      call-center
      </description>
```

Ant clean all ile build yapınca modelimize gelir.

-avansasFacade-beans.xml'de secondName attribut'ü Customer data'ya ekliyoruz. Ve build yapıyoruz.

```

</bean>

<bean class="de.hybris.platform.commercefacades.user.data.CustomerData">
  <property name="fullName" type="String"/>
  <property name="secondName" type="String"/>
  <property name="phoneNumber" type="String"/>
  <property name="landPhone" type="String"/>
  <property name="optinSms" type="boolean"/>
  <property name="optinEmail" type="boolean"/>
  <property name="optinCallCenter" type="boolean"/>
  <property name="pwdChangeAllowed" type="boolean"/>
  <property name="priceDisplayStrategy" type="com.avansas.core.enums.PriceDisplayStrategy"/>
  <property name="gender" type="java.lang.String"/>
  <property name="isIndividual" type="boolean"/>
  <property name="hasOrder" type="boolean"/>
  <property name="identityNumber" type="java.lang.String"/>
  <property name="taxNumber" type="java.lang.String"/>
  <property name="taxOffice" type="java.lang.String"/>
  <property name="companyTitle" type="java.lang.String"/>
  <property name="industry" type="java.lang.String"/>
  <property name="subIndustry" type="java.lang.String"/>
  <property name="b2CCustomerTitleType" type="java.lang.String"/>
  <property name="b2CCustomerDutyType" type="java.lang.String"/>

```

-AccountPageController'da post edit profile'de customerData'ya secondName set ediyoruz

```

customerData.setEmail(avsb2BUpdateProfileForm.getEmail());
customerData.setUid(currentCustomerData.getUid());
customerData.setDisplayUid(currentCustomerData.getDisplayUid());
customerData.setSecondName(avsb2BUpdateProfileForm.getSecondName());

```

Sonra facade'da updateProfile metodunu çağırarak update etmektedir. Tabiki updateProfile metodunda `customer.setSecondName(customerData.getSecondName());` ekledikten sonra.

- AccountPageController'da Edit profile get metodunda :

CustomerData.getSecondName forma set ediyoruz.

Ve CustomerModeli customerData'ya çeviriyoruz (populate yaparak)

```
AvsCustomAccountPopulator.java
package com.avansas.facades.populators;

import ...

1 usage 1 Dila Bedir +11 *
public class AvsCustomAccountPopulator implements Populator<CustomerModel, CustomerData> {

    2 usages
    private SessionService sessionService;
    2 usages
    private AvsCommonB2BUnitService avsCommonB2BUnitService;

    1 yucehan +10 *
    @Override
    public void populate(CustomerModel source, CustomerData target) throws ConversionException {
        target.setFullName(source.getName());
        target.setSecondName(source.getSecondName());
        target.setPhoneNumber(source.getPhoneNumber());
        target.setLandPhone(source.getRegularPhoneNumber());
        target.setGender(source.getGender() != null ? source.getGender().getCode() : null);
        target.setEmail(source.getUid());

        final Optional<AvsStoreBasedCustomerSettingsModel> optionalAvsStoreBasedCustomerSettingsModel
        if(optionalAvsStoreBasedCustomerSettingsModel.isPresent()) {
            final AvsStoreBasedCustomerSettingsModel storeBasedCustomerSettingsModel = optionalAvsStoreBasedCustomerSettingsModel.get();
            target.setOptInSmsObjects(gggNull(storeBasedCustomerSettingsModel.getSmsOptIn()) ? storeBasedCustomerSettingsModel.getOptInSmsObjects() : null);
        }
    }
}
```

Sonra customerData'yı forma set ediyoruz.

-avansas uk'de olan update profile sayfasında secondName diye bir alan ekliyoruz .

```
<!-- SecondName Information Start -->
<label class="form-label">
    <span class="form-title">
        ${secondNameVar}
    </span>
    <input type="text" class="secondary-input justletter" id=""
        name="secondName" maxLength="1024"
        data-msg-required="<spring:theme code="{This field is mandatory}" text="Cannot"
        placeholder="<spring:theme code="{SecondName}" text="SecondName"/>"
        value="${avsB2BUpdateProfileForm.secondName}"
        autocomplete="off"
        required ${isB2B ? '' : 'readOnly'}>
    <form:errors path="secondName" cssClass="error" element="label"/>
</label>
<!-- Second Name Information Finish -->
```

-Serveri ayağa kaldırıp update deniyoruz .
